PROMPT

You are a linguistics expert with extensive experience in software engineering ethics within Computer Science.

I’m sending you, as input, a list of ethical concerns with their respective IDS. This list was obtained from both industry practitioners (through a questionnaire survey) and papers retrieved in the literature (through a mapping review). It is a list of ethical concerns that are widely addressed in their projects and developments.

Based on your expert knowledge, I need your help with the following task: cluster the words in this list according to semantic similarity. Concerns with similar meanings should be grouped into the same category. For example, we could have justice, fairness, and equality in a category. Maybe there will be some concerns that cannot be clustered (they will appear alone) and others that should appear in more than one category. If this last case happens, make it clear which concerns are clustered in different categories.

As output, you must deliver an Excel file where the first tab will contain the clustered concerns along with their IDS. In the second tab, you will explain in detail, for each clustering, the method used to arrive at the result, as well as the numbered sources you used to arrive at the result.

Before sending it to me, please verify your answer based on the criteria I explained to you.
